

High Frequency Trading

Very often mt4 expert advisor shows good profit on demo account, but doesn't show any profit on real accounts. I think every trader have faced such a situation. In most cases, this problem arises because of the difference in the execution of orders on the demo and live account. Traders try to solve this problem by finding a dedicated server or VPS with good internet channel and near brokerage company. This may lead to a slight reduction of execution time of orders, but this way you are not likely to succeed in solving the problem completely. Especially that brokers often introduced an artificial delay of execution of orders thus increasing their profits. How to resolve this problem? The best way is to use FIX API bridge between MT4 demo and technology / liquidity provider. You can find FIX API solution for PowerTradeCopier. Standard release of PowerTradeCopier allows you to copy trades from several MT4 accounts to several MT4 accounts. This software has a lot of benefits and has no analogues. But most important benefits of PowerTradeCopier; you do not need to run MT4 terminals, copier has no delay.
